

When it comes to tooth decay, you and your family have a choice.

Our practice provides **Curodont™**, a needle-free, drill-free treatment for early cavities.

What are your options?

DRILL TODAY

Restorative treatments such as filling, do not last forever. With time, more invasive procedures will be required.

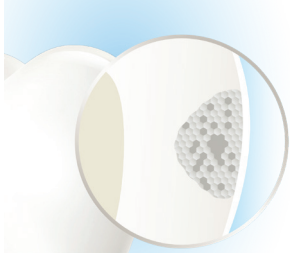

WAIT & DRILL LATER

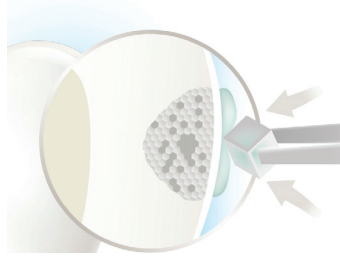

When left untreated, early cavities can progress and cause further damage to the tooth structure, possible tooth loss and even risk severe diseases.

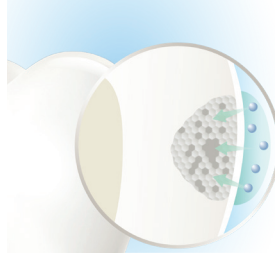

Choose Curodont™ a simple, effective, drill-free, needle-free treatment for early cavities.

Early cavity forms beneath the tooth surface.

The dental professional applies Curodont™ in office.

The formulation disperses to the depth of the early cavity.

Mimicking nature, Curodont™ treats the early cavity by restoring the lost minerals with the minerals from your own saliva.

Benefits of Applying Curodont™

- ✓ No drilling or injection needed
- ✓ One-time application, fast & easy in under 3 min
- ✓ Non-staining
- ✓ For permanent & primary teeth
- ✓ Tasteless
- ✓ Suitable for everyone
- ✓ No artificial fillers

Ask us if Curodont™ is right for you or your child.
